Project Development Phase
Performance Test

Date	10 February 2025
Team ID	PNT2022TMIDxxxxxx
Project Name	Project - Visualizing Housing Market Trends: An Analysis of Sale Prices and Features using Tableau
Maximum Marks	

Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	The housing dataset was successfully rendered in Tableau. The dataset includes features such as house sale price, number of bedrooms, number of bathrooms, floors, house age, renovation year, and basement area. Tableau processed the dataset and generated visualizations efficiently without performance issues.
2.	Data Preprocessing	Data preprocessing was performed before visualization. Duplicate records were removed, missing values were handled, and data types were verified. Numeric fields such as sale price and house area were assigned as measures, while categorical attributes such as renovation status were assigned as dimensions
3.	Utilization of Filters	Filters were applied in the dashboard to allow users to interactively explore the data. Examples include filters for house age, renovation status, and property features. These filters enable users to view specific data subsets and analyze housing trends effectively.
4.	Calculation fields Used	Calculated fields were used to derive meaningful insights from the dataset. Examples include average sale price calculation, house age computation, and aggregated values such as total sales and count of properties. These calculations help generate deeper insights from the housing dataset.

5.	Dashboard design	6	Story Design
